

Hypoglycemia: The Other Sugar Disease

Hypoglycemia is a condition in which the blood sugar level drops too low. This can cause a variety of symptoms, including sweating, shaking, hunger, and confusion. In severe cases, hypoglycemia can lead to seizures, coma, or even death.

Hypoglycemia is most commonly caused by diabetes. However, it can also be caused by other conditions, such as liver disease, kidney disease, and certain medications.

The symptoms of hypoglycemia can vary depending on the severity of the condition. Mild hypoglycemia may cause only mild symptoms, such as sweating and shaking. However, severe hypoglycemia can cause more serious symptoms, such as confusion, seizures, and coma.

Hypoglycemia is diagnosed with a blood sugar test. Treatment for hypoglycemia involves raising the blood sugar level. This can be done by

eating or drinking something sugary, such as juice or candy. In severe cases, hypoglycemia may require treatment with glucagon or intravenous glucose.

Preventing hypoglycemia is important for people with diabetes. This can be done by taking medication as prescribed, eating a healthy diet, and exercising regularly.

Symptoms of Hypoglycemia

- Sweating
- Shaking
- Hunger
- Confusion
- Dizziness
- Nausea
- Vomiting
- Seizures
- Coma

Causes of Hypoglycemia

- Diabetes
- Liver disease
- Kidney disease
