

Type VII Boats: The Most Successful U-Boat Type of World War II

By Roger Chesneau

The Type VII U-boat was the most successful submarine type of World War II, sinking more Allied shipping than any other type of U-boat. Developed in the 1930s, the Type VII was a medium-sized submarine with a streamlined hull and a powerful diesel-electric engine. It was armed with five torpedo tubes and a deck gun, and could carry up to 14 torpedoes.

The Type VII U-boat was first used in combat in 1939, and quickly proved to be a formidable weapon. Its streamlined hull and powerful engine gave it a high speed and maneuverability, and its five torpedo tubes allowed it to fire multiple torpedoes in a single attack. The Type VII U-boat was also equipped with a variety of sensors, including radar and sonar, which gave it a significant advantage over Allied ships.

The Type VII U-boat was used extensively in the Battle of the Atlantic, where it sank millions of tons of Allied shipping. The U-boats were particularly effective in the early years of the war, when they enjoyed a significant advantage over Allied anti-submarine warfare capabilities. However, as the war progressed, the Allies developed new anti-submarine technologies and tactics that made it more difficult for the U-boats to operate.

Despite the increasing Allied efforts, the Type VII U-boat remained a major threat to Allied shipping throughout the war. By the end of the war, the U-boats had sunk over 3,500 Allied ships, including 144 warships.

The Type VII U-boat was a highly effective submarine that played a major role in the Battle of the Atlantic. Its streamlined hull, powerful engine, and advanced sensors gave it a significant advantage over Allied ships. However, the U-boats were eventually defeated by the Allies' superior anti-submarine warfare capabilities.

This book provides a comprehensive account of the development, design, and operational history of the Type VII U-boat. It is a must-read for anyone interested in the history of submarines and World War II.
